Sage Consulting Releases *Sage HCM Scan* for Master Data Governance of SAP® ERP HCM

Add-On Solution Improves Quality of HR Personnel Data

TULSA, OK – January 3, 2012 – Sage Consulting LLC, a provider of SAP software solutions, recently announced the release of Sage HCM Scan, a new product that helps companies improve the data quality of the SAP® ERP HCM application. The solution conducts a thorough analysis of the HR personnel and organizational data stores using both standard and customer-defined business rules which results in a more stable and reliable HR system-of-record.

"Customers have told us they struggle with poor data quality and with enforcing the necessary controls to keep their human resources information accurate. With the increase of outsourced niche solutions, high service center agent turnover, and self-service web-hosted applications, it's becoming more difficult for system owners to feel at ease," said Steven Ritter, managing partner at Sage Consulting. "We are committed to helping customers overcome this challenge and give them peace-of-mind by providing a solution that quickly assesses the state of their employee personnel data."

Sage HCM Scan analyzes the SAP® ERP HCM Personnel Administration and Organizational Management tables according to the rules the customer deems as relevant to their specific business requirements. The product has a practical, intuitive interface and comes with an installed catalog of common scans and, based on its advanced design, can easily be customized to incorporate customer prescribed audits. The user receives an interactive report clearly displaying the immediate problem areas. The solution is delivered as an SAP ABAP® Add-On, fully integrated within the SAP application environment, with future product upgrades and enhancements easily applied.
